Pediatric Board Review Multiple Choice Questions & Answers Vol. 3

Sample Chapter 1

Here are some of the multiple choice questions which you will find in this book.

Q1. The most common site of pulmonary atelectasis in children is:

- Right upper lobe
- Right middle lobe
- Right lower lobe
- Left upper lobe
- Left lower lobe

Q2. A routine physical examination of a newborn reveals a grade 2/6, short, harsh systolic murmur at the apex. The newborn is completely asymptomatic. The most likely diagnosis is:

- Atrial septal defect
- Ventricular septal defect
- Mitral stenosis
- Mitral regurgitation
- Patent ductus arteriosus

Q3. All of the following conditions can present with spherocytosis in peripheral blood smear except:

- ABO incompatibility
- Thermal injury
- Wilson disease
- Autoimmune hemolytic anemia
- Pneumococcal sepsis

Q4. A 7-day-old newborn girl appears for a routine physical check-up. Her mother noticed grape-like mass protruding through the child's vagina. The girl is asymptomatic. The most likely diagnosis is:

- Vaginal prolapse
- Rectovaginal fistula
